CALCULATER PRO

A Smart Calculator Application Powered by Python and Tkinter

Presented by Ankita

Presented to NEXTHIKES IT

Introduction

Calculator Pro is a Python-based desktop application developed using the Tkinter library.
The project focuses on creating a modern, interactive, and user-friendly calculator that makes mathematical calculations simple and efficient.
It supports basic arithmetic operations as well as additional mathematical functions, including square root, square, power, and percentage.

Project overview

The Advanced Calculator is a Python-based application designed to perform mathematical calculations through an interactive and user-friendly interface. It aims to simplify calculations by providing multiple arithmetic operations with accurate and efficient results.

Project objectives

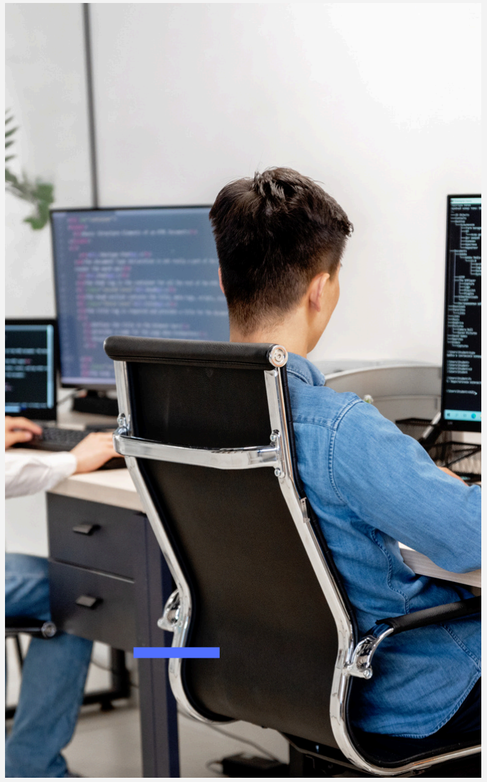

1. Unify useful tools

2. Make interaction intuitive

3. support advanced calculations

4. Improve reliability

5. Remain practical, offline

Working of calculater

- Enter the first number.
- Enter the second number.
- Select the mathematical operation.
- The calculator displays the result.
- Example: 10 + 5 = 15

Technology used

Python

Core programming language used to develop the calculator and implement mathematical logic

Tkinter & ttk

Used to create the graphical user interface (GUI), buttons, tabs, and input fields.

Math Library

Performs scientific calculations such as trigonometry, logarithms, factorials, and powers.

Statistics Library

Calculates mean, median, mode, standard deviation, and other statistical values.

Matplotlib

Generates graphical plots for statistical data analysis.

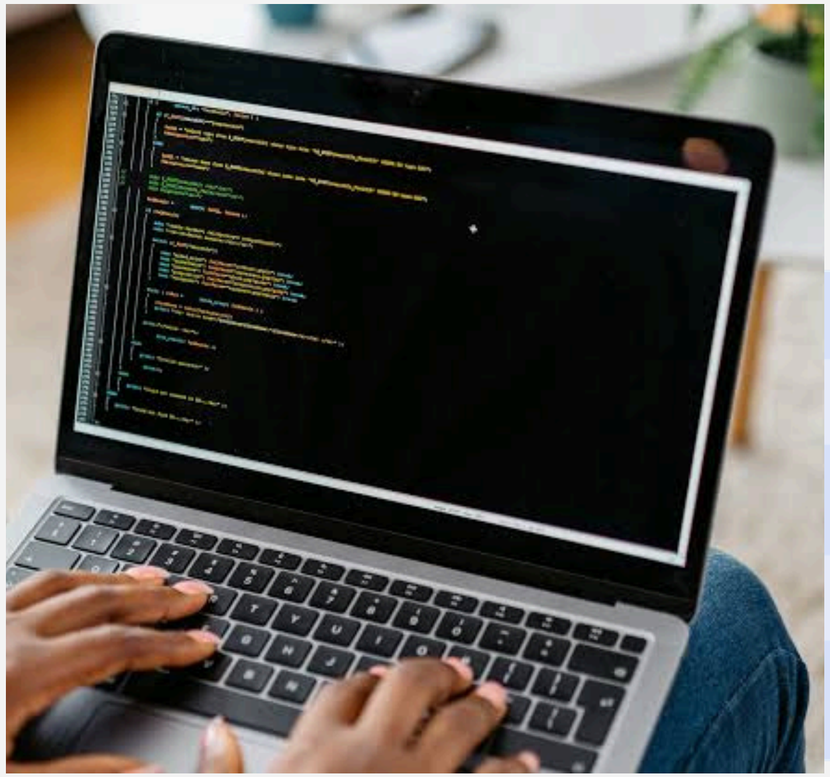

KEY HIGHLIGHTS

- Supports multiple mathematical operations.
- Accepts user input and processes calculations dynamically.
- Uses conditional statements and functions to manage operations.
- Handles invalid inputs and division-by-zero errors.
- Provides accurate and immediate calculation results.
- Developed using Python in Visual Studio Code.

Conclusion

This project helped me understand Python programming.
I learned how to use operators and conditional statements.
It improved my practical coding skills.

Thank you
